

Semivra Libellus POS - Complete Manual & Tutorial

For Kasa Lokal and white-label F&B deployments Last updated 2026-06-05

This document has two parts:

- **Part A - Quick-Start Tutorial:** the shortest path to taking your first order and closing your first day.
- **Part B - Full Reference Manual:** every screen, workflow, and rule explained.

Roles at a glance. The app has two kinds of users:

- *Owner / Superadmin - full access: accounting, users, settings, voids, reports. Not counted as a tracked employee (excluded from staff hours, shift history, and cashier variance).*
 - *Staff / Cashier / Manager - day-to-day POS, orders, inventory, their own shift. Locked out of accounting, user management, and other superadmin-only areas (these show a "Superadmin Only" lock).*
-

PART A - QUICK-START TUTORIAL

1. Log in

1. Open the app. Enter your **Admin Name** and **Password**.
2. **Staff/Cashier**: you must enter your **Starting Cash** (the float in the drawer, e.g. 1000). This opens your shift.
3. **Owner/Superadmin**: Starting Cash is optional.
4. Press **Log In**.

Your session stays signed in across page reloads. You'll see a brief "Restoring session..." splash while it reconnects - that's normal.

2. Take a sale (POS)

1. Go to **Orders & POS**.
2. Open the **Register**. Use the **search bar** to find a product, tap it to add to the cart. Adjust quantity with **+** / **-**.
3. (Optional) Add a **discount**: enter a **PHP** amount or **%** in the discount row.
4. Choose the **order type** (Dine-In, Takeout, Pickup, etc.) and enter the **customer name** if required.
5. Press **Charge / Place Order**.

3. Collect payment & send to kitchen

1. The order appears in the **Orders** list as **Pending**.
2. Tap **Prepare / Send to Kitchen**. For a **cash** sale, enter the **cash tendered** - the app shows the **change**.
(This is the moment cash enters your drawer and counts toward your shift.)
3. The kitchen marks it **Ready**, then **Delivered/Completed** when handed over.

4. Close your shift (End of Day)

1. Press **End Shift** (top of the screen).
2. Count your drawer and enter the **Actual Cash** (or use the denomination counter).
3. The app shows **Expected vs Actual** and the **variance**. Confirm to record the shift.
4. (Optional) Record a **bank deposit** of excess cash.

That's the core loop. Everything else below is detail and back-office.

PART B - FULL REFERENCE MANUAL

1. Logging in & sessions

Field	Who	Notes
Admin Name	everyone	Your account name
Password	everyone	Min 6 characters
Starting Cash	staff (required), owner (optional)	Opens a shift with this float

- **Security:** logins use a short-lived access token kept in memory plus a secure refresh cookie. Reloading the page keeps you signed in; **logging out fully revokes the session** on the server (a stolen session can't be reused).
- **Forgot/My password:** change your own password from your profile (requires your current password). Changing it logs out your other devices.
- **Owner-managed accounts:** only the owner can create staff, reset their passwords, or change roles (which also force-logs that user out).

2. The POS Register (Orders & POS)

Building an order

- **Search** by product name; tap to add. Large touch targets are tuned for tablets.
- **Modifiers / Add-ons / Sizes:** if a product has options (e.g. milk choice, size), you'll be prompted to pick them.
- **Quantity:** + / on each cart line.
- **Discounts:** inline row - enter either a peso amount (PHP off) or a percentage (%). SC/PWD and promo types are supported.
- **Order notes:** free text passed to the kitchen ticket.
- **Guest count:** for dine-in covers.

Order types (fulfilment modes)

Dine-In Takeout Pickup Manual Delivery Grab Delivery Foodpanda.

- **Pickup / Manual Delivery** collect address, phone, delivery fee, and scheduled time.
- **Grab / Foodpanda / Manual Delivery** are booked to **Accounts Receivable** (the partner owes you) until settled - they do **not** hit your cash drawer.

Checkout & payment

- The payment modal shows a **thermal receipt preview**, payment-method pills, and **quick-cash denomination buttons** (PHP 20-PHP 1000) with **Exact / Round** shortcuts and **live change** calculation.
- **Cash** is the only method that increases your drawer. E-wallet / bank / delivery channels book to A/R until you verify and settle them.

3. Order lifecycle

Pending Prepare-> Preparing -> Ready Deliver-> Completed
(cash tendered here)
-> Partially Delivered -> Completed

- **Pending:** placed, not yet paid or sent.
- **Preparing:** sent to kitchen; for cash, this is where you enter cash tendered (money enters the drawer).
- **Ready:** made, awaiting hand-off.
- **Completed:** delivered/closed - this is when the **revenue + COGS journal entries** post and inventory deducts.

- **Partially Delivered:** for multi-item orders where some items are handed over now and the rest follow ("Give Partial - More Items Coming"); ERP posts on final completion.
- **Park / Recall:** save an unpaid tab ("Park") and bring it back later from the parked list.
- **Complimentary:** zero-charge order (booked at cost, not selling price), with a required reason.
- **Void (owner only):** reverses a completed order - restores stock and posts reversing journal entries. Use instead of editing a completed order (completed orders are locked).
- **Refund (owner only):** posts a reversal journal for a returned/refunded sale.

4. QR self-ordering (customers)

- Each table gets a **QR code** (generate from the POS). Scanning opens the customer menu on the guest's phone.
- The guest builds an order against a **secure, single-use, time-limited session**; placing the order burns the session.
- Orders flow into the same kitchen queue. A "your order is ready" notification can be pushed to the guest.
- The owner can **open/close QR ordering** globally with the **QR Orders: OPEN/CLOSED** toggle (kitchen-busy switch). Staff POS is unaffected by this toggle.

5. Inventory & Stock

Units. You always work in **kg / L / pcs**. Internally the system stores base units (g / ml / pcs) for recipe precision and converts for display.

Core actions

- **Procurement (new item):** add an item with quantity, unit cost, low-stock threshold, and optional expiry. Posts an inventory asset journal entry.
- **Restock:** add stock to an existing item; appends a new expiry batch and books the purchase.
- **Edit item (owner):** rename, change unit/cost/threshold/expiry. **Stock quantity is not editable here** - use Restock / Spoilage / counts so the audit trail and ledger stay intact.
- **Spoilage / Waste:** log wasted stock with a required reason; posts DR Spoilage/Variance / CR Inventory and a stock-card entry.
- **Recipes:** each product (and add-on) has a recipe of inventory ingredients; completing an order deducts them automatically.

Expiry (FEFO - First Expired, First Out)

- Items can hold **multiple batches**, each with its own expiry, cost, and received date.
- The main view shows the **soonest** expiry with colour-coded badges (Expired / Today / warn-days / 30d).
- The **Expiry Watch** panel lists items expiring within 30 days.
- Order completion and spoilage consume the **oldest batch first**.
- **Manual batch add/remove (owner):** correct the physical batch breakdown. Adding a batch increases stock (booked as an inventory gain); removing one decreases stock (booked as a variance/write-off). Both keep stock and the ledger in sync - no stock "from thin air."

Excel / CSV bulk import & stock-take

- **Import** an .xlsx/.xls/.csv to bulk onboard or reconcile stock. Standard header: Code, Product, SRP, Qty Unit, Unit Cost, Expiry date (older formats still accepted).
- A **preview modal** shows a colour-coded diff (NEW / / / SAME / ERROR) before you commit.
- Differences post adjustment journals automatically (gain or variance), and every row writes a stock-card entry.
- Use the **Template** button to download a sample file.

Low-stock alerts. Set a per-item threshold; the sidebar and table badge items at or below it.

6. End-of-Day (EOD) inventory count

1. Open the **EOD / count** flow.
2. Enter the **physical count** for each item in display units (kg/L/pcs).

3. The app shows **System End vs Physical**, movement (Start / In / Out), and **variance** per item.
4. Submit to record the count and **lock** the day.

7. Shifts & cash control

- **Start:** opening a shift requires the **starting float** (staff).
- **During the shift:** the running **cash sales** total reflects cash that has actually entered the drawer - i.e. **completed cash sales plus paid in-progress orders** (cash tendered at the Preparing step). An order still sitting as *Pending* (not yet paid) shows PHP 0 until it's taken - that's correct.
- **End Shift:** count the drawer, enter actual cash, review **Expected vs Actual** and the **variance**. A non-zero variance posts a **Cash Short/Over** journal entry.
- **Bank deposit:** move excess drawer cash to the bank (keeps the starting float); posts a journal entry.
- **Shift History (owner):** full ledger of past shifts with variance colours. **X-Reading** prints a mid-shift summary PDF without closing the register.

Owner note: the owner/superadmin is not treated as a cashier. Owner shifts and clock entries are hidden from Shift History, Staff Hours, and Cashier Variance.

8. Staff time tracking

- **Clock In / Out** (and break) from the sidebar; the app tracks worked minutes for payroll.
- **Staff Hours (owner):** paginated list of clock entries by staff and date. The owner is excluded.

9. Accounting & Ledger (owner only)

Everything that moves money or stock posts a **balanced double-entry journal entry** automatically. The Ledger tab has these sub-views:

Sub-tab	What it shows
Journal	Every journal entry (paginated), with CSV export
P&L	Profit & Loss over a date range - revenue, COGS, OpEx, gross/net margin
Balance Sheet	Assets / Liabilities / Equity with a balanced-equation check
A/R Outstanding	Non-cash sales (e-wallet/bank/delivery) awaiting settlement - Settle each one
A/P Payables	Amounts you owe (on-account purchases/expenses)
Sales by Payment	Breakdown of sales by payment method over a range
Profit by Category	Gross profit and margin per menu category
Menu Engineering	Stars / Plowhorses / Puzzles / Dogs classification by sales margin
Cashier Variance	Average drawer variance per cashier (owner excluded)
Purchase Order	Suggested reorder quantities from usage + low-stock, with PDF export
Add Expense	Record an operating expense (cash or on-account)

All the report tables are **paginated** (10 rows per page).

Accounting rules to know

- **Non-VAT registered.** The system uses the percentage-tax model; receipts show "NON-VAT REGISTERED."
- **Cash vs A/R.** Only physical **cash** hits Cash on Hand immediately. Bank transfer, GCash, Maya, Maribank, e-wallet, Grab, Foodpanda, and manual delivery all book to **Accounts Receivable** until you settle them via the A/R sub-tab (choose where the money was deposited).
- **Balanced guarantee.** Every entry is asserted to balance (debits = credits) before it's saved.

Revolving / petty-cash funds

- **Create a fund:** name, initial amount, and **Paid From** (Cash on Hand or Cash in Bank) - the chosen account is credited in the opening entry, so the float comes from a real source, not thin air.
- **Out (disburse):** log a small expense paid from the fund (DR Expense / CR Petty Cash).
- **In (replenish):** top the fund back up from a chosen cash account.
- **History:** per-fund transaction ledger, paginated.

10. Settings (owner only)

Setting	Effect
QR Orders: OPEN / CLOSED	Globally accept or pause customer QR orders (staff POS unaffected)
Auto Close: ON / OFF	When ON, the system auto-cancels hanging orders, archives the day, and locks the register at midnight (PH time). When OFF, the day stays open past midnight and you must archive/close manually

Manual day-close / archive. The archive sweep force-cancels any hanging orders - **Pending, Preparing, Ready, and Parked** (held unpaid tabs) - then archives the day so cancelled and parked orders are never left dangling.

11. Superadmin Panel (owner only)

- **Users:** create staff, set roles, reset passwords, delete accounts. (Role/password changes log that user out.)
- **Roles:** manage the role list.
- Search, filter, and batch-update users.

12. Devices, offline & install

- **Tablet-first.** Touch targets, layouts, and contrast are tuned for tablets (e.g. Amazon Fire).
- **Install as app:** when the browser offers it, use **Install App** for a full-screen PWA.
- **Offline-first:** if the connection drops while placing an order, it's **queued locally** and **auto-syncs** when you're back online - you won't lose the sale.
- **Receipts/printing:** kitchen tickets and receipts print to a connected thermal printer; receipts show "NON-VAT REGISTERED" and any delivery details.

13. Common tasks - step by step

Void a completed order (owner)

Orders -> find the completed order -> **Void** -> enter reason. Stock is restored and reversing entries post. (You can't void an already-settled A/R order.)

Settle a delivery / e-wallet sale (owner)

Ledger -> **A/R Outstanding** -> **Settle** on the order -> confirm amount and the deposit account. Posts **DR** cash / **CR** A/R.

Record an expense (owner)

Ledger -> **Add Expense** -> amount, category, paid-from (or On Account), vendor, date.

Reorder stock

Ledger -> **Purchase Order** -> **Generate** -> review suggested quantities -> **PDF** to send to your supplier.

Pause customer QR ordering when slammed (owner)

Sidebar -> **QR Orders** -> toggle to **CLOSED**. Switch back to **OPEN** when ready.

Keep the register open past midnight (owner)

Sidebar -> **Auto Close** -> toggle **OFF** (confirm). Remember to archive the day manually.

14. Troubleshooting

Symptom	Cause / fix
Login fails / immediately logs out	Server `ALLOWED_ORIGINS` must list the exact frontend URL. Check with the deployer.
"Restoring session..." then login screen	Session expired or was revoked - log in again.
Shift cash shows PHP 0 after a sale	The order is still Pending (cash not yet collected). Send it to Preparing and enter cash tendered.
A non-superadmin sees "Superadmin Only" locks	Expected - accounting, users, settings, voids are owner-only.
Order won't change after Completed	Completed orders are locked by design - use Void instead.
"Too many requests"	Rate limit hit (e.g. rapid retries) - wait a moment and retry.
Excel import shows ERROR rows	Fix the flagged rows (bad qty/unit/cost) and re-import; the preview won't commit errors.

15. Glossary

- **COGS** - Cost of Goods Sold (recipe ingredient cost of items sold).
- **FEFO** - First Expired, First Out (oldest-expiry batch consumed first).
- **A/R** - Accounts Receivable (money owed to you, e.g. by delivery partners).
- **A/P** - Accounts Payable (money you owe, e.g. on-account purchases).
- **EOD** - End of Day (inventory count + register lock).
- **X-Reading** - mid-shift sales summary that does **not** close the register.
- **Variance** - Actual cash counted minus expected cash.
- **Float / Starting Cash** - the cash you start a shift with.
- **Non-VAT** - registered under percentage tax, not VAT.

Questions about a workflow not covered here, or a screen that behaves differently? Note the exact screen and step and it can be added to this manual.
