Client Review & Onboarding

Version

Semivra Libellus POS v1.1

Date

May 30, 2026

Tax Compliance

Non-VAT Registered (BIR Philippines)

What is Semivra Negotium & Libellus?

Semivra Negotium & Libellus is a complete Point-of-Sale (POS) and business management system designed for small to medium food and beverage businesses in the Philippines — cafés, milk tea shops, cloud kitchens, and similar operations.

It replaces the combination of a cash register, a manual stock notebook, a separate accounting spreadsheet, and a paper order pad — with one system that runs on any device with a web browser.

In simple terms: it is the digital brain of your café operations. From the moment a customer orders to the moment your accountant needs a report — it is all in one place, automatically recorded.

What does the name mean?

"Negotium" is Latin for business or trade. It refers to the operational side — the POS register, order management, delivery tracking, and kitchen workflow.

"Libellus" is Latin for a small book or ledger. It refers to the accounting side — the journal, profit & loss reports, inventory logs, and balance sheet.

Together they form two sides of one coin: the front of the house (negotium) and the back office (libellus), unified in a single system.

What device does it run on?

It runs on any device with a modern web browser — a tablet (Android or iPad), a laptop, or a desktop computer. No special POS hardware is required. A ±5,000 Android tablet and a Wi-Fi connection is enough to get started.

Does it need internet?

The system requires an internet connection or a local network (LAN). The recommended setup is to run the server on a small cloud service (about ±200– ±800/month) so staff can connect from any device in the store. An offline mode is not yet available — see the Issues Report for details.

Section 2

May 2026

Who is this system built for?

Semivra Libellus was designed specifically for the Philippine F&B (food and beverage) small business context — but it applies to any similar business that needs a reliable, affordable, all-in-one POS.

Best fit — these businesses will get the most value

- Cafés and coffee shops
- Milk tea and boba shops
- Small restaurants and carinderia-style operations
- Cloud kitchens (delivery-only, no dine-in)
- Kiosks and food stalls with a counter
- Any food business with 1 to 5 cashier stations
- Businesses registered as Non-VAT with the BIR
- Operators who want real accounting records without hiring a bookkeeper for daily entries

Less ideal for — consider alternatives

- Large restaurant chains with 50 or more tables (multi-branch sync not yet available)
- VAT-registered corporations requiring automatic VAT invoice generation
- Grocery or retail stores (product catalog is oriented toward F&B)
- Businesses that need to work completely offline with zero internet connection
- Businesses that need a native app on the App Store or Google Play

Why choose Semivra over other POS systems?

Philippine small business owners typically face a difficult choice: expensive imported POS platforms that charge in US dollars, or basic local systems that lack proper accounting. Here is how Semivra compares:

Feature	Semivra	Typical Local POS	Square / Toast (US)
Monthly software fee	One-time setup	±500– ±2,000 / month	\$60–\$165 USD / month
Hardware required	None — browser	Dedicated terminal	iPad + card reader
Real accounting (double-entry ledger)	Yes '✓'	No '✗'	Basic only
Non-VAT BIR compliance	Yes '✓'	Partial	No (VAT-focused)
Inventory with expiry date tracking	Yes '✓'	No '✗'	Paid add-on
QR code customer self-ordering	Yes '✓'	Rare	Paid add-on
Delivery tracking (Grab / Foodpanda)	Yes '✓'	No '✗'	No '✗'
Custom branding for white-label clients	Yes '✓'	No '✗'	No '✗'
Server location	PH cloud or LAN	Windows PC on-site	US-based servers

Bottom line: Semivra is the only Philippine-focused POS that includes real double-entry accounting, Non-VAT compliance, expiry-tracked inventory, and QR self-ordering — all in one system, with no recurring subscription fee.

What can it do? — Full Capability Guide

Below is a complete list of everything the system can do as of version 1.1. Each capability is explained in plain language. No technical knowledge is needed to read this section.

1. Point-of-Sale (POS) Register

The cashier screen where orders are built and payments are processed. The cashier searches or browses products, adds items to the order, applies discounts, selects the payment method, and issues a receipt.

Payment methods accepted: Cash, GCash, Maya, Maribank, Bank Transfer, and other e-wallets.

Discount types: flat peso amount (e.g. ±50 off) or percentage (e.g. 10% off). Complimentary or free orders are also supported for staff meals.

A live change calculator shows the cashier exactly how much change to give for cash payments.

2. Customer QR Dine-In Ordering

Each table has a unique QR code. A customer scans it with their phone, sees the full menu with photos and add-on options, builds their order, and submits it — no app download needed.

The order goes directly to the kitchen queue on the cashier screen. This reduces wait time, eliminates miscommunication between waiter and kitchen, and frees up staff for other tasks.

The QR session expires after the order is submitted, so the link cannot be reused by another customer.

3. Fulfillment Modes (6 types)

Every order is tagged with how it will be served. The system supports: Dine-In, Takeout, Pickup (customer collects later), Manual Delivery (your own rider), Grab Delivery, and Foodpanda.

For delivery orders, the system collects the delivery address, customer phone number, delivery fee, and scheduled delivery time.

4. Delivery Dispatch Tracking

Delivery orders have a visual pipeline showing their current stage: Preparing !' Out for Delivery !' Delivered. Pickup orders use: Preparing !' Awaiting Pickup !' Picked Up.

Staff can advance the status with one tap. This gives you a real-time view of which deliveries are in progress at any moment.

5. Inventory & Stock Management

Every ingredient is tracked by quantity — in kilograms (kg), litres (L), or pieces (pcs). When an order is completed, the system automatically deducts the ingredients used based on the recipes you define.

You never have to manually update stock counts after a sale — it happens automatically and instantly.

You can set a low-stock alert level for each ingredient. When stock falls at or below that level, a warning badge appears on the sidebar so staff are reminded to reorder.

6. Expiry Date Tracking & FEFO

Each ingredient can have an expiry date. The system tracks multiple batches of the same ingredient separately — for example, one carton of milk received on Monday and another received on Friday.

When stock is consumed, the system always uses the oldest batch first. This is called FEFO — First-Expiry, First-Out. It reduces waste and ensures fresher stock is not used before older stock.

Colour-coded badges on each ingredient show its status: expired (red flashing), expiring today, expiring soon (yellow), expiring within 30 days (orange), or safe (grey).

7. Spoilage & Waste Logging

When ingredients are thrown away — due to spoilage, damage, or over-production — the operator logs a waste entry with the quantity, reason, and notes.

The system records this in the accounting ledger automatically, so your profit & loss report accurately reflects the real cost of spoilage.

8. Excel / CSV Stock-Take Import

Instead of entering every ingredient one by one, you can prepare a spreadsheet (Excel or CSV) with your full stock count and import it in bulk.

The system shows a preview of all changes before you confirm: new items are highlighted green, increases are shown as arrows up, decreases as arrows down.

A template file is available to download so you always know the correct format to use.

9. Shift & Cash Management

At the start of each shift, the cashier enters the starting cash amount in the register (the float). At the end of the shift, they count the actual cash and enter it into the system.

The system calculates the expected amount based on all cash sales during the shift and shows the variance — the difference between expected and actual cash.

All shift history is visible to the manager: who worked each shift, their starting cash, ending cash, and any variance that was recorded.

10. Real Accounting — Double-Entry Ledger

Every transaction in the system creates a proper accounting journal entry — automatically. This includes sales, refunds, free orders, spoilage, inventory purchases, and expenses.

Double-entry accounting means every peso has a corresponding opposite entry that keeps the books balanced. For example, when a cash sale is made: Revenue increases, and Cash on Hand also increases.

This is the same standard used by professional accountants. You do not need a separate bookkeeping app or manual spreadsheet for daily entries.

11. Accounts Receivable (E-Wallet & Delivery Payments)

When a customer pays by GCash, Maya, bank transfer, or through a delivery platform, the money is not physically in the register yet — it needs to be verified and transferred to your account.

The system records these as Accounts Receivable (money owed to you) until your manager confirms the transfer was received and marks it as settled.

This prevents confusion between "sales recorded" and "cash actually in hand."

12. Profit & Loss (P&L) Statement

The system generates a Profit & Loss report for any date range you choose. It shows: Total Revenue, Cost of Goods Sold, Gross Profit, Operating Expenses, and Net Income.

This is the report your accountant or BIR auditor will ask for. It is generated automatically from your daily transactions — no manual preparation needed.

13. Balance Sheet

A snapshot of your business financial position at any point in time: Assets (cash, inventory), Liabilities (money you owe), and Equity (your net value in the business).

The system verifies that the accounting equation balances and shows a check indicator.

14. Expense Tracking

Record any business expense — rent, utilities, supplies — with the amount, category, description, and which cash account it was paid from.

Expenses are posted to the accounting ledger automatically so they always appear in your P&L report.

15. Real-Time Analytics Dashboard

A summary screen showing today's performance: total gross sales, number of orders, average order value, top-selling products, and an hourly sales chart.

Updated in real time as orders are processed — no manual refresh needed.

16. User & Role Management

Two types of accounts: Staff (cashiers and kitchen crew) and Super Admin (managers and owners).

Staff can use the POS, process orders, and manage deliveries but cannot see financial reports, accounting ledgers, or change system settings.

Super Admin has full access to everything. This ensures sensitive business data is only visible to authorised personnel.

17. Receipts — Non-VAT Compliant

Every completed order generates a receipt showing the itemised breakdown, payment method, cashier name, date, and a "NON-VAT REGISTERED" footer — required by the BIR for non-VAT businesses.

Receipts appear on screen and can be printed using the browser's print function.

18. End-of-Day History & X-Reading

At midnight every day, all completed orders are automatically archived. You can browse any past day's orders and filter by cashier or payment method.

X-Reading: A mid-shift report that shows sales up to that moment without closing the register — useful for spot-checking totals during a busy day.

Section 5

May 2026

Version History — How the System Has Grown

Semivra Libellus has been developed in stages. Each version added new capabilities on top of everything before it. This history shows what was built and when — so you can see how the system has matured.

v0.2

FOUNDATION

Early 2026

The first working version. Proved the concept — customers could see a digital menu and place an order.

- Digital menu with product photos, categories, and pricing
 - QR code generation for tables
 - Basic order flow: customer submits, cashier sees the order
 - Admin login with a secure JWT security token
 - Order status tracking: Pending !' Ready !' Completed
 - MongoDB database foundation: products, orders, categories
-

v0.45–v0.48

CORE POS

Early 2026

The cashier register was built. The system became usable as a real daily POS.

- Full POS cashier interface — product catalog, add-ons, cart, and checkout
 - Multiple payment methods: Cash, GCash, Maya, Bank Transfer
 - Discount system: flat peso discount and percentage discount
 - Inventory tracking — stock levels, restock entries, and stock history
 - StockCard audit trail: every stock movement is permanently recorded
 - Real-time order updates across all connected devices
 - First accounting journal entries automatically linked to completed orders
-

v0.5

ACCOUNTING

Early 2026

Real accounting was wired in. Every sale, void, and free order now creates proper double-entry ledger records.

- Double-entry journal ledger — visible and searchable by the admin
 - Automatic cost-of-goods (COGS) calculation on every completed sale
 - Void order workflow with full accounting reversal (undoes every journal entry)
 - Complimentary (free/staff meal) order type — records cost only, no revenue
 - Automatic end-of-day archiving at midnight
 - Analytics dashboard: gross sales, order count, and average order value
-

v0.55

SHIFTS

Early 2026

Shift management and role-based access controls were added.

- Shift start: cashier enters starting cash amount before taking any orders
- End-of-shift reconciliation: expected cash vs. actual cash, variance recorded
- Full shift history for management review
- Role-based access: Staff sees POS only; Super Admin has full access

- Partial delivery state for large orders: "Give Partial — More Items Coming"
-

v0.6–v0.7

SECURITY

Early 2026

A full security audit was conducted and all critical vulnerabilities were resolved.

- Login rate limiting: prevents password guessing attacks (brute force)
 - Cashier identity taken from the secure login token — not from the order form (prevents impersonation)
 - Voiding an order restricted to Super Admin only
 - Inventory editing locked to Super Admin only
 - CRITICAL fix: staff could previously change the admin password — resolved
 - Removed a hardcoded PIN code and secret token that were exposed in the app
 - All financial and inventory endpoints now require a valid login
-

v0.9–v1.0

ENTERPRISE READY

May 2026

Upgraded to enterprise grade: full accounting suite, delivery management, expiry tracking, and production deployment infrastructure.

- Profit & Loss Statement with a date-range picker
 - Balance Sheet — auto-calculated with balance verification check
 - Accounts Receivable tracking for e-wallet and delivery payments
 - Expense entry with automatic accounting journal posting
 - Complete Chart of Accounts with standard account codes (1000–6200)
 - Delivery dispatch pipeline with 6 fulfillment modes
 - Expiry date tracking per ingredient with colour-coded warning badges
 - FEFO batch tracking — oldest stock is always consumed first
 - Multi-batch inventory — track separate deliveries of the same ingredient
 - Excel / CSV bulk stock-take import with diff preview before confirming
 - Spoilage / waste logging with automatic accounting journal entry
 - Low-stock alert badges on the sidebar
 - Shift history archive with variance colour coding
 - X-Reading mid-shift report
 - NON-VAT REGISTERED label on sidebar and all receipts
 - Docker deployment containers for easy cloud setup
 - GitHub automated test suite: 75 tests pass on every code change
-

v1.1

CURRENT VERSION

May 30, 2026

Unit display and Excel import were standardised for operator convenience.

- Operators only ever see kg, L, and pcs — never raw grams or millilitres
 - Excel import format simplified to 5 columns: Code, Product, Qty+Unit, Unit Cost, Expiry
 - Smart name parsing: writing "Milk 1L" in the spreadsheet auto-detects the unit
 - Physical stock count in the EOD audit now shows display units (kg/L/pcs)
 - SRP (suggested retail price) field removed — not applicable in Non-VAT model
 - All 75 automated tests passing; clean build on both server and client
-

Pros & Cons — An Honest Assessment

No system is perfect. Below is an honest assessment of what Semivra does very well and where it currently has limitations. The limitations are explained in full detail in the separate Issues Report.

Strengths — What Semivra does well

- **No monthly subscription fee**

You pay for the setup once. There is no recurring software bill — only your cloud server hosting (roughly ±200– ±800/month).

- **Works on any device**

A tablet, laptop, or desktop with a browser is all you need. No expensive dedicated POS hardware required.

- **Real double-entry accounting built in**

Most POS systems record sales but cannot produce a proper P&L or Balance Sheet. Semivra generates these automatically from your daily operations.

- **Non-VAT compliant from day one**

Receipts, journal entries, and reports are structured correctly for non-VAT registered businesses. No phantom VAT amounts anywhere.

- **QR self-ordering reduces workload**

Customers order directly from their phone at the table. This reduces staff workload, eliminates order errors, and speeds up service.

- **FEFO batch tracking protects product quality**

Older stock is always consumed before newer stock — automatically. This reduces waste and supports food safety.

- **Full audit trail — nothing can be silently changed**

Every stock movement, sale, void, and accounting entry is permanently recorded. Nothing disappears quietly.

- **Staff cannot see sensitive financial data**

Role-based access means cashiers and kitchen staff cannot see your revenue reports, accounting, or void completed orders.

- **E-wallet and delivery payments tracked as receivables**

GrabFood and Foodpanda payments are recorded as Accounts Receivable until you confirm receipt of the payout.

- **Automatic inventory deduction on every sale**

No manual stock counting after each sale. Ingredients are deducted based on recipes the moment an order is completed.

- **Customisable for any F&B brand**

Colours, branding, and product categories are configurable — suitable for white-label deployment to multiple café clients.

▪ **75 automated tests protect the system**

May 2026

Every time the code is updated, 75 automated tests verify that accounting, unit conversions, and batch logic are still correct.

Limitations — What it cannot yet do

▪ **Requires internet or LAN**

The system does not work without a network connection. If the internet drops during service, orders cannot be processed digitally. A local LAN setup mitigates this for most cafés.

▪ **No offline mode**

There is no "work offline and sync later" capability. A full offline mode is a significant development project — it is on the roadmap but not yet built.

▪ **Single café per installation**

Each deployment serves one business location. A second branch would need its own separate installation. Combined multi-branch reports are not yet available.

▪ **No direct thermal printer connection**

Receipts and kitchen tickets print via the browser's print dialog. There is no automatic print-on-order or direct thermal printer driver integration.

▪ **No mobile app**

The system runs in a browser. There is no native iOS or Android app available on the App Store or Google Play.

▪ **No loyalty / rewards programme**

There is no built-in customer points system or stamp card. Discounts can be applied manually but automatic loyalty rewards are not available.

▪ **No payment terminal integration**

GCash and Maya payments are confirmed manually by the cashier. There is no card reader or e-wallet terminal that auto-confirms transactions.

▪ **Analytics runs on the device**

Charts and calculations run inside the browser. With a very large order history (many months of data), this may slow down on older tablets.

▪ **Technical setup required**

Initial deployment requires a developer to configure the server, database, and environment settings. It is not yet a self-serve one-click install.

Summary: The limitations listed above are either planned improvements for future versions or deliberate scope decisions (e.g. Non-VAT focus). None of them prevent the system from being used effectively as a daily POS for a Philippine café today.
