

Semivra Libellus POS

Update & Changes Report

Version 3.0 Release Notes

System	Semivra Libellus POS
Client / Brand	Kasa Lokal
Report Type	Update & Changes Report (since v2.0)
Version	3.0 — PWA / Enterprise Operations
Compliance	Non-VAT Registered · No BIR integration
Stack	React 18 + Vite PWA / Express + MongoDB + Socket.io

Table of Contents

1	Executive Summary

11	Security, Performance & Fixes
12	New API Endpoints
13	Test & Build Status

SECTION 1: EXECUTIVE SUMMARY

Version 3.0 builds on the v2.0 enterprise foundation and turns Semivra Libellus into a true installable, offline-capable Progressive Web App (PWA). This release adds the operational features a working cafe needs every shift — a product "86" availability system with automatic out-of-stock hiding, required modifier groups (e.g. "choose your milk"), split-tender multi-payment, a dedicated refund workflow, kitchen-only print tickets, cash denomination counting, the official Z-Reading end-of-day report, staff time clock, and deeper accounting reports (Accounts Payable, profit by category, sales by payment method). All work respects the business's Non-VAT status — no BIR, VAT, or e-invoicing logic was introduced.

Metric	Value
New feature areas	13
New API endpoints	20+
PWA capabilities	Installable · Offline order queue · Push
Tests passing	75 / 75 (vittest)
Build status	server node --check OK · client vite build clean
Compliance posture	Non-VAT · No BIR — unchanged

SECTION 2: PWA — INSTALLABLE & OFFLINE POS

KEY: This is the headline of v3.0: the dashboard and customer menu can now be installed to a tablet's home screen and keep taking orders even when the WiFi drops.

2.1 Installable App

- Added `manifest.webmanifest` — standalone display, dark theme, app shortcuts ("Open Register", "Customer Menu")
- Generated proper icon set from the brand logo: 192px & 512px standard + maskable (Android adaptive) variants
- `index.html` — manifest link, theme-color, Apple/Android web-app meta tags, notch-safe viewport
- "Install App" button appears in the sidebar only when the browser offers installation

2.2 Offline Capability

- Service worker rewritten: app shell precached; navigations network-first with cached fallback; assets stale-while-revalidate
- Offline order queue — when the POS is offline or the network drops mid-sale, the order is saved to local storage instead of being lost
- Auto-sync — queued orders replay to the server automatically the moment connectivity returns; failures stay queued for the next attempt
- API calls bypass the service worker entirely so financial data is never served stale
- Versioned cache (semivra-v2) with automatic cleanup of old caches on update

2.3 Operator Visibility

- Offline / sync banner across the top of the dashboard — red when offline, amber "Syncing N orders..." with a manual "Sync now" button when reconnecting
- Header status pill (mobile) showing offline state or pending-queue count with a live sync spinner
- nginx tuned: `sw.js` and the manifest set to no-cache so PWA updates always reach devices

NOTE: Scope: offline mode covers taking manual POS orders and loading the cached app. Completing orders (ERP/inventory) still requires a connection — queued orders settle automatically once back online.

SECTION 3: MENU AVAILABILITY & "86" SYSTEM

- Manual "86" toggle per product (PATCH /api/products/:id/availability, superadmin) — instantly hides an item from the customer menu and POS
- Automatic out-of-stock hiding: GET /api/products computes stockAvailable — any product whose recipe has a zero/empty ingredient disappears from the customer menu automatically
- Real-time sync: completing an order that depletes an ingredient now emits menuUpdated, so the customer menu updates live mid-service
- POS register shows greyed-out "86" / "Out" badges on unavailable products (staff can still see them to explain to customers)
- Every availability toggle is written to the audit log (who 86'd what, and when)
- Pricing masterlist now shows Recipe Cost, Gross Margin % (colour-coded), and an ON/OFF availability switch per product

Procurement Account Selection

- Receiving / restocking inventory now lets the operator choose the funding account: Cash on Hand, Cash in Bank, or Accounts Payable (buy on credit)
- Journal entries credit the chosen account instead of always crediting Cash on Hand

SECTION 4: REQUIRED MODIFIER GROUPS

NEW: Products can now require a choice before they can be added to the cart — e.g. "Choose your milk: Full Cream / Oat / Soy". Both the customer menu and staff POS enforce this.

- New ModifierGroup model: name, required flag, min/max selections, and priced options each with their own recipe
- CRUD endpoints (/api/modifier-groups) — superadmin manages groups; products attach them via checkboxes in Menu Setup
- Customer menu: required groups render as radio (pick one) or checkbox (pick many) selectors; "Add to Cart" is blocked until all required groups are satisfied
- POS register: identical validation before an item can be added
- Selected modifiers flow through to the receipt and kitchen ticket and deduct their own recipe ingredients on completion

SECTION 5: PAYMENTS, REFUNDS & SPLIT TENDER

5.1 Multi-Payment / Split Tender

- An order can now be paid with multiple methods (e.g. ■100 cash + remainder GCash)
- POS checkout has a "Split Pay" toggle with per-row method + amount, a live allocated-vs-total indicator
- The ERP journal posts one debit line per payment method; single-payment orders are unchanged

5.2 Refund Flow (distinct from Void)

- New POST /api/orders/:id/refund (superadmin) — for genuine returns where the sale happened
- Posts a reversal journal entry (DR Sales Revenue / CR cash account), marks the order REFUND, and writes an audit-log entry
- Partial refunds supported (amount defaults to full total, capped at the order total)
- Refund button added to completed order cards (superadmin only), alongside Void

SECTION 6: ORDER MANAGEMENT ENHANCEMENTS

Feature	Description
Order notes	Customers and cashiers can add special instructions ("no sugar, extra ice"); shown on order cards, receipt, and kitchen ticket
Kitchen print ticket	One-tap kitchen copy — large item names, quantities, add-ons, order number, notes — and NO prices
Active table strip	Coloured chips above the order grid show occupied tables by status; tap to filter that table's orders
Kitchen "All Done" state	Order card border turns green with an "All Done" badge once every item is finished/delivered
Order search	Live search of active orders by customer name, order number, or table
Archive search + dates	History tab search by name / order # / cashier with from–to date range and result count
Guest / cover count	POS records number of guests per order for future spend-per-cover analytics

SECTION 7: CASH & SHIFT MANAGEMENT

7.1 Cash Denomination Breakdown

- End-of-shift modal replaced the single cash field with a ■1000–■1 bill/coin count grid; the total computes automatically
- A manual total field remains as a fallback; the counted total feeds the variance calculation

7.2 Z-Reading (Official End-of-Day Report)

- New Z-Reading PDF — full day close: net sales, payment-method breakdown, void / cancel / complimentary counts
- Complements the existing X-Reading (mid-shift snapshot); both available from the History tab

SECTION 8: ACCOUNTING & REPORTING

Report	What it shows
A/P Payables	Outstanding supplier balance (account 2000), recent A/P journal history, and a "Record Supplier Payment" workflow (DR A/P / CR cash)
Profit by Category	Per-category revenue, estimated COGS (from recipes), gross profit, and margin % — colour-coded
Sales by Payment	Date-ranged breakdown of revenue per payment channel (Cash, GCash, Maya, Bank, delivery) with % share bars — for daily reconciliation
System Activity Log	Real audit-log viewer: price changes, 86 toggles, password changes, refunds, A/P payments — who and when

All reports respect Non-VAT accounting — gross receipts only, no VAT separation, no BIR forms.

SECTION 9: STAFF MANAGEMENT & AUDIT

- Staff time clock: `/api/clock/in`, `/api/clock/out`, `/api/clock/status` — sidebar shows live "Clocked In · Xm"; History tab has a "Staff Hours" report with durations
- Staff self-service password change (`PATCH /api/users/me/password`) — verifies current password; sidebar + mobile button
- Audit-log API (`GET /api/audit-logs`) — paginated, filterable, surfaced in the Audit tab

SECTION 10: OPERATIONS & AUTOMATION

- Open / Closed QR toggle — superadmin can stop accepting customer QR orders when the kitchen closes (staff POS unaffected); a Settings store backs system-wide flags
- Daily Telegram summary — after the midnight auto-close, a revenue / orders / top-item summary is pushed to a configured `TELEGRAM_WEBHOOK_URL` (owner sees the day on their phone, no login)
- Product image by URL — paste an image link as an alternative to uploading

SECTION 11: SECURITY, PERFORMANCE & FIXES

- Add-on create/delete routes secured with `requireSuperAdmin` + error handling
- Inventory delete hardened (superadmin, 404 guard, socket emit)
- Analytics dashboard rewritten as MongoDB aggregation pipelines — no longer loads all orders into memory (OOM-safe at scale)
- Archived products excluded from the menu; bare async routes wrapped in `try/catch`
- All new mutating routes gated by role and write to the audit log where appropriate

SECTION 12: NEW API ENDPOINTS

Method & Path	Purpose
<code>PATCH /api/products/:id/availability</code>	86 / restore a product
<code>GET/POST/PUT/DELETE /api/modifier-groups</code>	Manage required modifier groups
<code>POST /api/orders/:id/refund</code>	Issue a refund (reversal journal)
<code>GET /api/finance/ap-outstanding</code>	Accounts Payable balance + history
<code>POST /api/finance/ap-payment</code>	Record a supplier payment
<code>GET /api/reports/profit-by-category</code>	Gross profit by menu category
<code>GET /api/reports/sales-by-payment</code>	Revenue by payment channel
<code>GET /api/audit-logs</code>	Paginated system activity log
<code>GET/PATCH /api/settings[:key]</code>	System toggles (QR open/closed)
<code>POST /api/clock/in · /out</code> , <code>GET /status · /entries</code>	Staff time clock

PATCH /api/users/me/password	Staff self password change
GET /api/orders/archives (search/date)	Archive search + date filter

SECTION 13: TEST & BUILD STATUS

NOTE: server node --check OK | vitest 75 / 75 passing | client vite build clean | PWA assets emitted to dist

Check	Result
Server syntax (node --check)	Pass
Unit tests (vitest)	75 / 75 pass
Client production build (vite)	Clean
Manifest + service worker in dist	Verified
PWA icons (192/512 + maskable)	Generated & shipped
Non-VAT / No-BIR posture	Unchanged — no tax logic added

Deployment note: set TELEGRAM_WEBHOOK_URL in the server .env to enable the daily summary. After deploying, open the app in Chrome on the tablet, then use the browser menu or the in-app "Install App" button to add it to the home screen. Toggle DevTools → Network → Offline to verify the offline order queue.
